

Structural confidence and sensitivity analyses

Primary: 163 S/T/Y-to-A substitutions across 48 yeast proteins · UniProt-annotated active and binding residues · AlphaFold DB monomer models

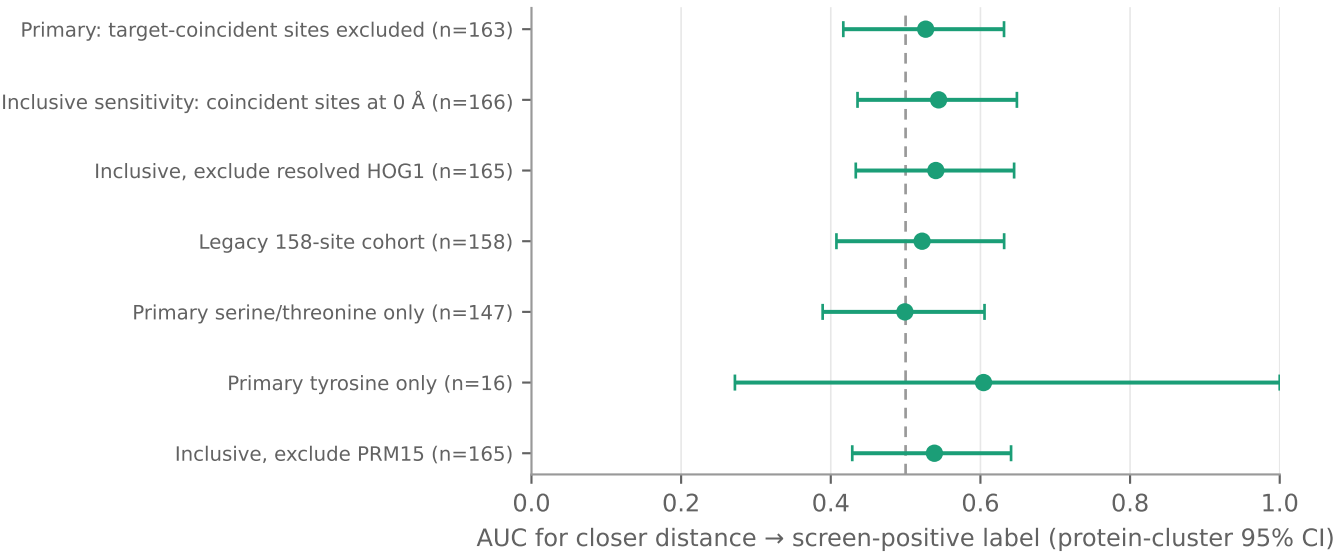

A Observed distance distributions

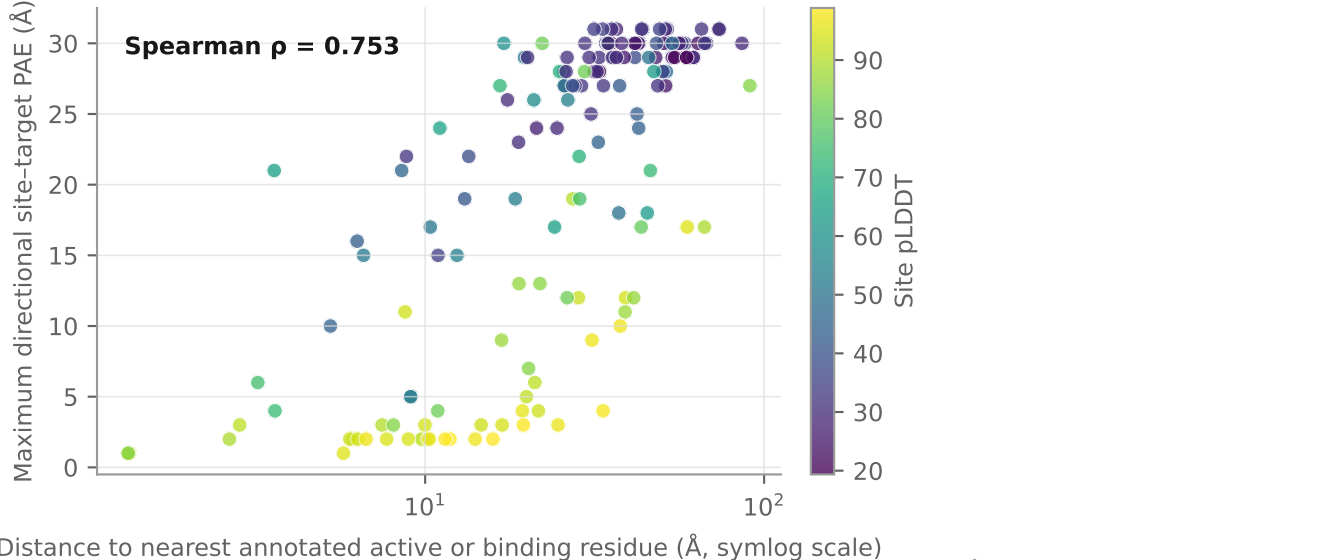

B Structural-confidence sensitivity

C Cohort and residue-class sensitivities

D Distance is associated with relative-position uncertainty

Primary AUC 0.527 [0.417, 0.632]. Adjusted linear-probability wild-cluster $p=0.675$. Three target-coincident substitutions are excluded from primary and retained at 0 Å only in the named sensitivity.

All PAE strata use the maximum of the two directional site-target values. Analyses are exploratory; intervals resample proteins, and threshold families were examined after the outcome.
